I build products through to live use and stay responsible for releases, integrations and production fixes. My work spans business operations, financial services, real-time communications and education. The projects below cover my work across mobile applications, backend services and web products.

01 / BizOPD

Business operations | Node.js, TypeScript, React and Flutter

Custom-order businesses need to connect customer orders with production, stock, payments and the people doing the work.

Lead and sole engineer. Owned implementation, technical decisions and deployment across web and mobile; translated business workflows into APIs, interfaces and executable delivery tasks.

A live web/mobile platform bringing orders, production, inventory, payments and team coordination into one workflow. Continued responsibility includes integration fixes and product changes.

Website | Android app

02 / NPF Connect

Real-time communications | Flutter, REST APIs and WebSockets

Authorized personnel need controlled communication and access to digital services, including when connectivity is unreliable.

Took the Flutter application from implementation to live release. Delivered officer messaging, role-based access, biometric sign-in, cached conversations, reconnection and retry behaviour, plus payment-service interfaces.

A published application combining direct and group communication with airtime, data, utility services and transaction records. Public app details document offline access and WebSocket reconnection.

Google Play - NPF Connect

PAYMENTS, WEB AND CUSTOMER WORKFLOWS

03 / EasySpend

Consumer finance | Flutter, Riverpod, payment APIs and Zoho Apptics

Customers need a usable journey from account funding to wallets, virtual cards and payments.

Led mobile implementation and Android/iOS delivery. Connected wallet and card interfaces to payment APIs; owned mobile updates and used Zoho Apptics to investigate application behaviour and guide production fixes.

Published mobile experiences for NGN/USD wallets, stablecoin funding and virtual-card workflows. My responsibility covered the mobile product and integrations; financial infrastructure was provided through integrated services.

iOS app | Android app

04 / AAACOHS Portal

Education operations | Node.js, TypeScript and React

Students, applicants and staff need online access to institutional services and admissions information.

Owned full student/staff portal implementation through live deployment. Built responsive application and admission-status interfaces connected to backend services.

An operational portal providing online application and institutional-service workflows. The web interfaces and backend services support the same institutional workflows.

Live portal

05 / Picsible

Photo-commerce workflows | Node.js, TypeScript, React and Flutter

Customers need to move from photo selection and customization to an order and checkout.

Owned implementation through live delivery across the customer interfaces and backend integrations for customization, ordering and checkout.

A customer-facing photo product connecting personalization with commerce. The interfaces connect photo customization with ordering and checkout.

FURTHER DELIVERY AND ENGINEERING DEPTH

06 / Reepay

Utilities | Flutter and payment APIs

Customers need a single journey for airtime, data and utility payments with an accessible payment record.

Owned Flutter implementation, API integration and live delivery of purchase flows, transaction histories and receipts.

A published utility-payment application giving customers purchase access and records of completed transactions.

Android app

07 / Mustard.ng

Crypto / Naira services | Flutter, GetX and KYC APIs

Customers need identity onboarding connected to transaction interfaces.

Delivered Flutter/GetX workflows and KYC/verification integrations from implementation to release.

Published mobile journeys connecting onboarding with crypto and Naira payment services.

Android app | iOS app

Technical work

Full-stack delivery. Node.js/TypeScript services, React web applications and Flutter clients; PostgreSQL and other relational/document databases; technical plans, releases and production support.

Data and controlled delivery. Hands-on experience with Redis, database transactions/locking and feature flags/A/B testing across BizOPD, AAACOHS Portal and Picsible.

Reliability and quality. Real-time WebSocket clients, offline caching/retry, authentication and biometric access; unit, widget and integration testing; QA collaboration and root-cause investigation.

Cross-team execution. Integrated 40+ APIs at Talosmat for a Singapore logistics application, working with backend engineers and QA to resolve legacy defects. Earlier mobile team leadership and full-stack teaching inform how I explain decisions and guide implementation.
